TIFFANY & CO. VIEWS THE PROTECTION OF THE ENVIRONMENT AS BOTH A MORAL OBLIGATION AND A BUSINESS IMPERATIVE. WE PROUDLY STATE THAT THIS BOOKLET IS PRINTED ON PAPER THAT IS CERTIFIED BY THE FOREST STEWARDSHIP COUNCIL® (FSC®). IT CONTAINS FIBER FROM FORESTS THAT ARE CAREFULLY MANAGED, RESPONSIBLY HARVESTED AND ADHERE TO STRICT ENVIRONMENTAL AND SOCIOECONOMIC STANDARDS.

TIFFANY, TIFFANY & CO., T&CO., the TIFFANY BLUE BOX and the color TIFFANY BLUE are trademarks or registered trademarks of Tiffany and Company and its affiliates. ©2019 Tiffany and Company. TGPJ16
SINCE 1837, TIFFANY & CO. HAS MAINTAINED THE VERY HIGHEST STANDARDS IN DESIGN, MATERIALS AND CRAFTSMANSHIP. THIS IS THE REASON THAT TIFFANY JEWELRY IS TREASURED WORLDWIDE AND PASSED DOWN FROM ONE GENERATION TO THE NEXT.

TO BECOME A BEAUTIFUL HEIRLOOM, HOWEVER, JEWELRY MUST BE PROPERLY CARED FOR. DUST, POLLUTION AND DAILY WEAR CAN CLOUD THE BRILLIANCE OF A GEMSTONE AND DULL THE SURFACE OF PLATINUM, SILVER OR GOLD. TIMEWORN PRONGS OR CLASPS MAY RESULT IN THE LOSS OF A STONE OR AN ENTIRE PIECE OF JEWELRY. SOME SIMPLE, BASIC CARE CAN HELP PRESERVE AND PROTECT YOUR TIFFANY JEWELRY FOR YEARS TO COME.
BASIC JEWELRY CARE

Professional cleanings are recommended as frequently as once a year, depending on how often you wear your jewelry. Tiffany’s Customer Service Department and Sales Professionals can assist you.

Our craftsmen are experienced in all aspects of jewelry care, from determining the best method for cleaning stones to restringing pearls to repairing clasps or earring backs.

Between professional cleanings, most jewelry can be maintained with a nonabrasive jewelry cleaner. To clean diamonds, use a mild solution of six parts water to one part ammonia and apply with a soft bristle brush. If worn often, pearls should be cleaned and restrung professionally once a year. In between cleanings, wipe pearls gently with a damp cloth. Ultrasonic cleaning is not safe for many gemstones, so we advise against this method.

Examine your jewelry regularly to make sure the settings are snug and the clasps and joinings are secure. Prong settings are particularly vulnerable. If hit against a hard surface or snagged on clothing, they may loosen, risking the loss of a gemstone.

Avoid exposing gold jewelry to household bleach, which will quickly cause gold to discolor and possibly disintegrate.

Sterling silver tarnishes rapidly when exposed to salty air, swimming pool chlorine and products containing sulfur, such as rubber gloves and certain papers. To remove tarnish, we recommend a nonabrasive silver polish.

Storage is also important. At the time of purchase, all Tiffany jewelry is packaged in a protective box, case or tarnish-resistant pouch. Between wearings, we recommend that you place your jewelry in its original casing or another suitably lined box or pouch.

Certain basic precautions should be taken with all of your jewelry. However, some gemstones, as outlined in this booklet, require special care.
For nearly four thousand years, the beauty of gemstones has been enhanced by various methods. Long before modern stone-cutting techniques were developed, oils and dyes were used to bring out the color in stones. Since the ancient Egyptians, emeralds have been soaked in colorless oil to make them appear more beautiful. This practice continues today.

Long ago it was discovered that heating certain gemstones could produce remarkable changes in color. Legend has it that Marco Polo observed the application of heat to rubies in Ceylon and introduced the practice to Europe. In fact, it was a heating process that first unlocked the intense violetish-blue of tanzanite, the gemstone introduced by Tiffany in the 1960s.

Take care to protect your jewelry from impact against hard surfaces and avoid contact with abrasive surfaces. Even a diamond can chip if hit with enough force or at just the right angle. Many stones such as amethyst, emerald, kunzite, opal, pearl, peridot, tanzanite and tourmaline are very delicate and easily abraded. Enameling can also chip or scratch when struck. Gemstones can scratch other gemstones and wear away at precious metals. Therefore, avoid stacking those rings and bracelets that would be vulnerable to such abrasion. Extreme temperatures, perfumes, cosmetics and household chemicals can also damage jewelry.

We suggest that you avoid wearing your jewelry during activity that would expose it to risks.
Tiffany selects only the finest gemstones from around the world. Our gemstones are inspected for quality, beauty and durability. Tiffany selects only those stones that meet our exacting standards for color, clarity and cut. We accept enhancements that are solely meant to improve the beauty of the stone.

Tiffany will not accept any enhancement that increases a stone’s carat weight.

Tiffany will not accept any enhancement that masks the potential durability of a gemstone.

Enhancements accepted by Tiffany have good stability unless otherwise noted on the chart that follows. We must stress that Tiffany diamonds have not been subjected to any enhancements, other than cutting and polishing.

Some gemstones require more care than others. Please refer to the following guidelines to help ensure that your Tiffany jewelry will be enjoyed for generations.

COMMONLY USED ENHANCEMENTS

Among the enhancements often applied by miners and lapidaries are:

BLEACHING  The use of chemicals or other agents to lighten or create a more uniform color.
DIFFUSION  The use of chemicals and high temperatures to produce or improve color.
DYEING  The introduction of coloring agents into a gemstone to improve or alter color.
HEATING  The use of heat to alter the color and/or clarity of a gemstone.
INFUSION  The filling of a gem material with a colored or colorless substance such as oil, wax, resin or glass to improve the gemstone’s appearance.
COATING  The application of wax, resin or oil to a porous gemstone to improve durability and beauty.
IRRADIATION  The use of laboratory radiation to alter a gemstone’s color. Usually followed by a heating process.
STABILIZED  The use of a colorless resin or a proprietary process without a resin to decrease porosity and improve durability and color.

In recent years, technology has produced new methods of gemstone enhancement. Many of these processes are difficult to detect and may involve various materials that are virtually unidentifiable, even with the most advanced scientific equipment. This has led to complex debates concerning what is acceptable in the gemstone community.
